Satin	In Stock	In Stock
Matt	In Stock	In Stock

PRODUCT TESTING MEANS ARCHIVAL LIFE YOU CAN COUNT ON.

GMS has completed testing Aquathane-UV in combination with InkjetPro Premium Edition and InkjetPro Commercial Edition canvas products. Both products were printed with genuine Epson 9800 Matt Ultrachrome Ink. The tests were completed without the usual protective glass layer as canvas is displayed in the open.

GMS accelerated fade tests were conducted independently by the Image Permanence Institute (IPI) in the USA. The combination of Aquathane-UV, Inkjet Pro Premium Edition Canvas and Epson Ultrachrome ink did not reach endpoint (failure) in any of the 81 colour patches tested, including unprinted canvas, in the equivalent of 102 years exposure.

FULL LAB REPORTS FOR CUSTOMERS WHO NEED TO KNOW.

GMS believes in full disclosure of the results where they are needed, such as with museum work. GMS makes available the full lab reports for InkjetPro canvas products to those customers with a genuine need to know.

All current GMS supplied canvas products have been subjected to accelerated light fade tests and you can use these products with confidence if coated with Aquathane-UV and displayed in accordance with the testing methodology.

SUPERIOR PROTECTION FOR THE AUSTRALIAN CLIMATE.

Aquathane-UV is made in Australia specifically for pigment printed canvas products and contains nano technology UV inhibitors, flexibility and anti-fungal agents.

Aquathane-UV's base resin is a type of flexible urethane not an inexpensive lacquer or acrylic. Although much more expensive than acrylics, urethanes are better suited to the Australian climate offering more resistance to the Australian heat and being fully waterproof after curing.

PROFESSIONAL APPLICATORS. A PERFECT FINISH EVERY TIME.

Aquathane-UV is water based and best applied with a turbine High Volume Low Pressure (HVLP) spray gun. These devices are used in the close confines of the spray tanning industry and are ideal for applying Aquathane-UV on a canvas print.

HVLP guns have no compressors and very minimal loss of fluid in the air. They apply an even smooth finish to the canvas giving a professional result.

Alternatively, Aquathane-UV can be rolled using a GMS supplied hand roller. Rolling, however, is only recommended when using full gloss variations of the product.
